 - Creative Commons Attribution 3.0
- **The program source code are licensed under a:**
 - GPL 3.0

II

Instalation and how to use

- Pandoc (needs to be installed)
- Deck.js (included)

- First **copy the doc folder and rename it as you like**. This is not necessary but helps you organize your documents.
- **Create the md files** that you want to generate. The md files are Markdown files which are nothing more than plain text files with extension md, and a lightweight markup (we should know it but it is very simple).
- Once created the md files, we can **generate html, html-slides y pdf-beamer with a script**.

- To **convert all md files of all the folders** go to the root folder and execute:

```
./build.sh
```

- To **convert all md files of one folder** go to the root folder and execute:

```
./build.sh [folder_name]
```

Slide keyboard shortcuts

[F] - Find text
[M] - Miniature slides
[G] - Go to slide number
[ctrl]+[+] - Zoom in
[ctrl]+[-] - Zoom out
[ctrl]+[wheel mouse] - Zoom in/out
[space] - Next page
[intro] - Next page
[page up] - Next page
[up arrow] - Next page
[right arrow] - Next page
[backspace] - Previous page
[page down] - Previous page
[down arrow] - Previous page
[left arrow] - Previous page
