 - Creative Commons Attribution 3.0
- **The program source code are licensed under a:**
 - GPL 3.0

II

Instalation and how to use

- Pandoc 1.11.1 (needs to be installed)
- Deck.js (included)

- First copy the doc folder and rename it as you like. This is not necessary but helps you organize your documents.
- Create the md files that you want to generate. The md files are Markdown files which are nothing more than plain text files with extension md, and a lightweight markup (we should know it but it is very simple).
- Once created the md files, we can generate html, html-slides y pdf-beamer with a script.

- To build html, slides in html or slides in pdf-beamer from md, go to the root folder and execute:

`./build.sh` - To convert all md files of all the folders

`./build.sh [folder_name]` - To convert all md files of one folder

- [F] - Find text
- [M] - Miniature slides
- [G] - Go to slide number
- [P] - Pointer mouse
- [ctrl]+[+] - Zoom in
- [ctrl]+[-] - Zoom out
- [ctrl]+[wheel mouse] - Zoom in/out
- [space] - Next page
- [intro] - Next page
- [page up] - Next page
- [up arrow] - Next page
- [right arrow] - Next page
- [backspace] - Previous page
- [page down] - Previous page
- [down arrow] - Previous page
- [left arrow] - Previous page
